

## Introduction

This program is made for apartment leasing business. Since, keeping all the important data in one place for quick reference would mean the personals working at the front desk would be able to work more effectively. I have contacted the user, an owner of a small apartment building, about how great it would be to have a program to manage the numbers of empty rooms and keep the information on the lessee. The user think it would be a nice idea if I could really write up this program as it would help him in his management of the apartment.

## Current System

The current system the user use is on paper. When a lessee agrees to rent a room the user have them fill out the contact on paper. This method cause a lot of trouble since there must be many folders to keep all the paper work. However, it is curial to the user that this method remains intact, and that the software would run alongside the current system. The second problem is that the user has to go through many books to see if a room is empty and available for rent or was it reserved by someone else. The problem associated with the current system is that if there are a lot of people working with the paperwork, it gets messy and confusing.

what rooms?  
where?

## Analysis

I questioned the user on what he thinks should be in the program.

- What information do you need on the lease contact?
- Do you need a password system to keep the files protected?
- Should there be a way to show the status of all the rooms at once? And a way to should only one status e.g. Empty rooms only?

The questions were answered as followed

1. The information that would be store are personal information about the lessee such as name, gender, contact number, address, and many more.
2. A password system is required in order to protect the information of the lessees. However, it only needs one user which is for the administration.
3. Yes, there should be a way to sort the rooms. If I want to see only the empty rooms or only the rooms that are reserved. This would keep track of how many empty rooms there is.

## Data Input

The user would be able to input the information into the system by typing it in. The file would be saving on to a text file that would be easy for the user to print out.

## Benefits

This program would allow the user to keep data in an organized way for quick reference. While the current system would be used alongside the new one, this allows fast tracking of each room.

## Goals

- Login System which allows the user to control who is allowed to view the information
- Keep track of all rooms
  - By room status – All rooms, empty rooms, occupied rooms, and reserved rooms
- Display information on lessee
  - View Name, Gender, Date of Birth, Age, Address, Contact, Occupation, Date of contract, Months of contract, Security deposit, etc
- Change the status of room
  - Allow user to make reservations
  - Allow user to make occupations

AZ ?

## Improvements

- Change to GUI
- Change Password and Username
- Allow printing
- Change to include Billing system
  - Price on water per credit
  - Price on electricity per credit
  - Telephone system

Z  
goals

## Prototype Screen

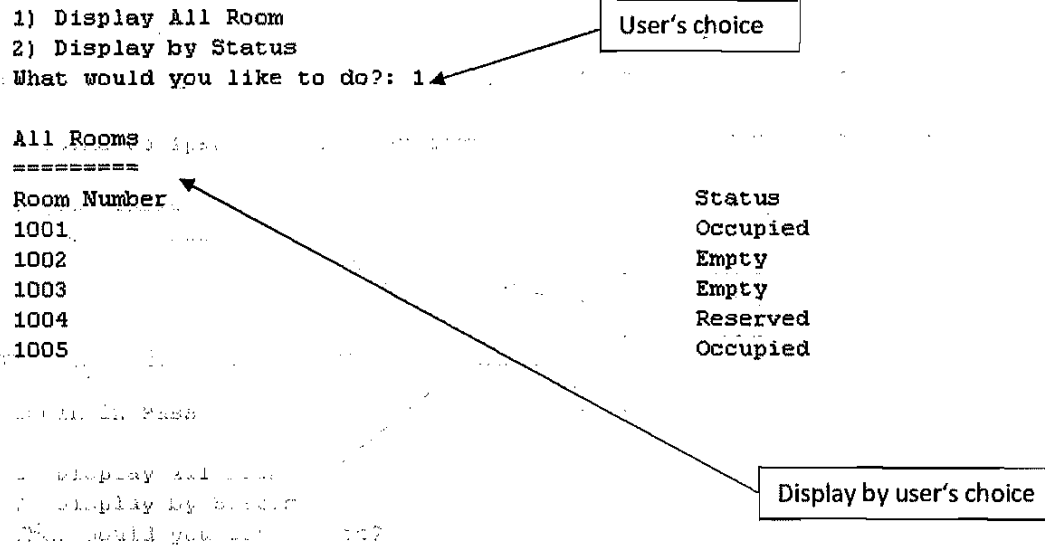

Starting of the Program – Start of the program with welcome page and ask for login

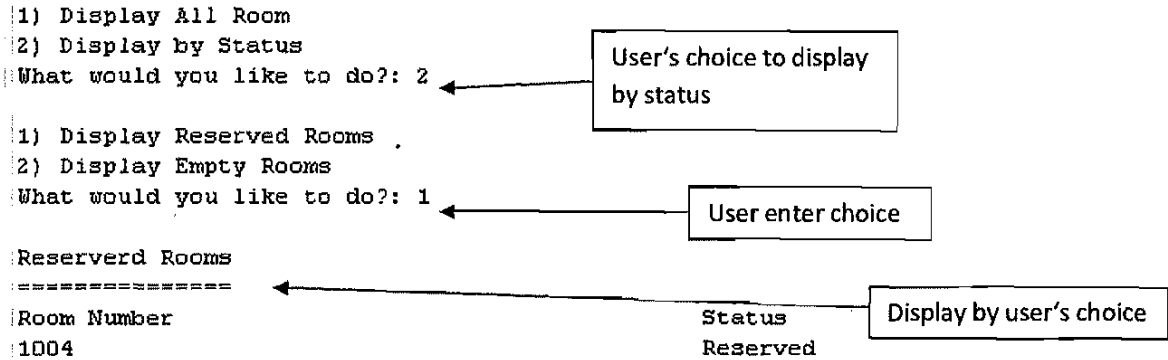

Option Menu – Show options to do

Display All Rooms - Shows all rooms with the status of Occupied, Empty or Reserved

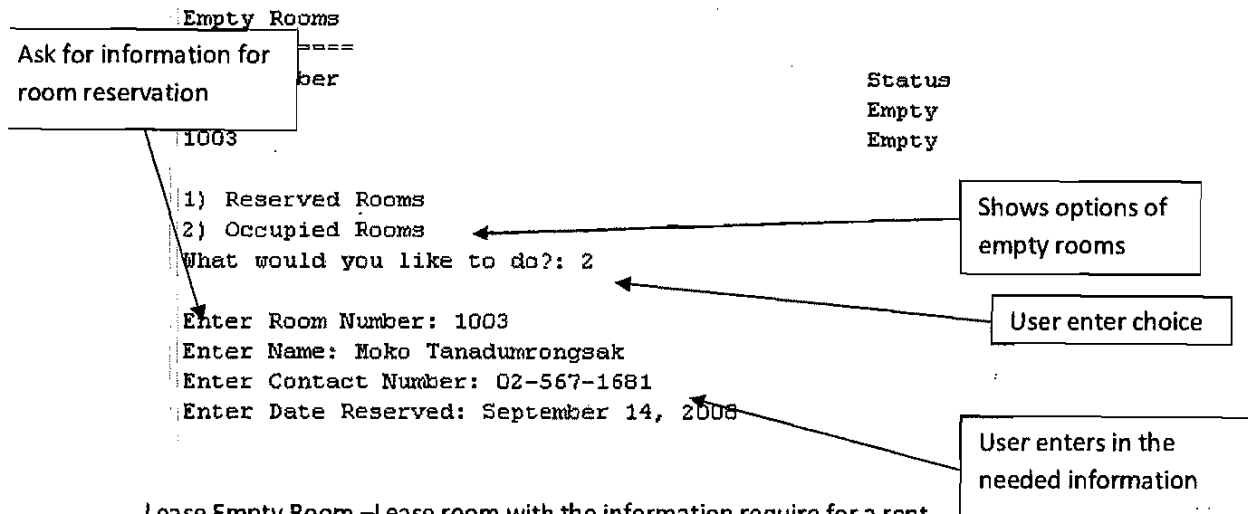

Display Reserved Rooms – Show only reserved rooms for easy view

Display Empty Rooms – Shows empty room to change status

### Reserve Empty Room - Reserve an empty Room and information required

### Lease Empty Room - Lease room with the information require for a rent
